

## 7. INDUSTRIAL WASTES

ISWFA defines industrial solid waste as "solid waste generated by manufacturing or industrial processes that is not a hazardous waste regulated under subtitle C of RCRA. Such waste may include, but is not limited to, waste resulting from the following manufacturing processes: Electric power generation; fertilizer and agricultural chemicals; food and related products and by-products; inorganic chemicals; iron and steel manufacturing; leather and leather products; nonferrous metals manufacturing/foundries; organic chemicals; plastics and resins manufacturing; pulp and paper industry; rubber and miscellaneous plastic products; stone, glass, clay and concrete products; textile manufacturing; transportation equipment and water treatment. This term does not include mining waste or oil and gas waste."

### Policy of the Clay Peak Landfill

Industrial wastes that may be considered as normal municipal solid waste are those wastes that may be landfilled without any special procedures, handling, or testing by landfill personnel. Each industrial waste and/or waste stream, which does not meet the above criteria, may be evaluated individually to determine if the waste will be accepted. The burden of proof that a particular industrial waste and/or waste stream is an acceptable innocuous waste is solely the responsibility of the waste generator. Any industrial wastes, which fit the above criteria, will not automatically be accepted at the landfill. The Payette County Board of Commissioners reserve all rights to either accept or reject any industrial waste and/or waste stream regardless of data supplied by the waste generator.

The County encourages industrial waste generators to evaluate their waste stream(s) to minimize, detoxify, and recycle as much of the waste stream as possible.
